

1. A National Bank:

*1) The System used in this application is main frame System.

Main Frame System.

→ The System which allows user to do lots of work ~~simult~~ at same time.

→ It acts as a central unit.

→ It allows for transactions for all the users in different location.

Explanation:

*1) In this application Bank act as a Main Frame and it allows all the users from different location to access their personal account for 100's of years.

*2) It is reliable and efficient for this application.

Advantage:

*1) It is reliable and efficient

*2) It is centralized, means protected

2. A Car Airbag:

The System used in this application is Hard Real-time Operating System [RTOS]:

RTOS:

- Real time operating system more reactive when the time limit or error happens.
- It is Quick responsible system.

Explanation:

* In this application for an airbag to burst at an accident or incident it requires a fast responsible system.

* Hence, RTOS is very reactive.

* If any accident or movement happens to react quickly.

Advantage:

* It is more reactive

* Applicable for the event when the time period is ended.

3. A Network printer:

The System used in this application is waiting Time.

Waiting Time:

- Waiting time is happened in the CPU
- It accept the request from the user then wait.
- FIFO concept is achieved.
- One by one the request is cleared in the system.

Explanation:

- * The user who needs the printer to print send request and then he will wait until the request is cleared.
- * So, the waiting time system is suitable.

Advantage:

- * There is no clash between users.
- * There will be privacy in the work.

Q 4. A Storage device:

The system used in the application is secondary storage device (SSD)

SD:

- *1 A storage device will allow user to use
- *1 which improve performance of the system.
- *1 It is faster compared to other storage devices.

Explanation:

- The computer system prefers SSD because it is faster compared to other storage devices.
- And it improves the performance of the system.

Advantage:

- *1 Faster
- *1 Improve performance
- *1 Speed.

The University Application:

The System used in this application distributed operating System.

Distributed OS:

* OS which connects different system.

* It is used to minimal the work.

* And access to everyone.

Explanation:

* For this application it connects all the students

* It allows everyone to modify or upload.

Advantage:

* It is a big space

* It connects all the users.
